 This ACO risk standardized all condition Skilled Nursing Facility readmission quality measure is adapted from a Skilled Nursing Facility Readmission measure developed by RTI International. The measure is modeled after the risk standardized all condition hospital readmission quality measure developed by Yale in 2011 and updated by Yale in 2014 (Horwitz et al., 2014).

# **Measure Description**

 Risk-adjusted rate of all-cause, unplanned, hospital readmissions within 30 days for Accountable Care Organization (ACO) assigned beneficiaries who had been admitted to a Skilled Nursing Facility (SNF) after discharge from their prior proximal hospitalization.

#### Rationale

The anticipated benefit of this quality measure is that if consumers are informed of SNF readmission rates, they will make more educated choices with regard to SNF providers. The SNFRM was developed using FFS claims to harmonize with CMS' current Hospital-Wide Readmission measure and other readmission measures being developed for other post-acute care settings [i.e., inpatient rehabilitation facilities (IRF), long-term care hospitals (LTCH), home health agencies (HHA), and end-stage renal disease facilities (ESRD)], and to promote shared accountability for improving care transitions across all settings. Additionally, providers will be encouraged to compete on quality by focusing on improvement efforts to reduce readmissions. The measure can also be used by providers for tracking results of their internal quality improvement initiatives.

Hospital readmissions of Medicare beneficiaries discharged from a hospital to a SNF are prevalent and expensive, and prior studies suggest that a large proportion of readmissions from SNFs are preventable (Mor et al., 2010). According to Mor et al., based an analysis of SNF data from 2006 Medicare claims merged with the Minimum Data Set (MDS), 23.5 percent of SNF stays resulted in a rehospitalization within 30 days of the initial hospital discharge. The average Medicare payment for each readmission was \$10,352 per hospitalization, for a total of \$4.34 billion. Of these rehospitalizations, 78 percent were deemed potentially avoidable, and applying this figure to the aggregate cost indicates that avoidable hospitalizations resulted in an excess cost of \$3.39 billion (78 percent of \$4.34 billion) to Medicare (Mor, Intrator, Feng, et al., 2010). Several analyses of hospital readmissions of SNF beneficiaries suggest there is opportunity for reducing hospital readmissions among SNF beneficiaries (Li et al., 2012; Mor et al., 2010), and multiple studies suggest that SNF structural and process characteristics can impact readmission rates (Coleman et al., 2004; MedPAC 2011).

In addition to being costly, readmission to the hospital interrupts the SNF beneficiary's therapy and care plan, causes anxiety and discomfort, and exposes the beneficiary to hospital-acquired adverse events such as loss of functional status, healthcare-associated infections or medication errors (Covinsky, Palmer, Fortinsky 2003; Boockvar, Fishman, Kyriacou 2004; Ouslander et al. 2011).

# **Clinical Recommendation Statement**

ACOs will have incentives under the Medicare Shared Savings Program and Pioneer Model to manage the range of medical care, coordination of care, and other factors affecting readmission rates for their assigned beneficiaries. By taking responsibility for all aspects of the medical care of their assigned beneficiaries, ACOs may be able to influence SNF choices

based on quality, and/or be able to assess the range of possible interventions affecting readmissions and then select the interventions appropriate for their beneficiaries.

#### **Denominator**

#### Denominator Statement

The denominator includes all beneficiaries who have been admitted to a SNF within one day of discharge from a prior proximal hospitalization, taking denominator exclusions into account, where the beneficiary was age 65 or older, was continuously enrolled in fee-for-service Medicare Part A for at least one month after discharge, was not discharged to another acute care hospital, was not discharged against medical advice, and was alive upon discharge and for 30 days post-discharge. Beneficiaries with SNF stays in swing bed facilities are included in the measure. The prior proximal hospitalization must include admissions to an IPPS acute-care hospital, CAH, or a psychiatric hospital.

#### Denominator Details

Admissions are eligible for inclusion in the measure if:

- 1. Beneficiary is enrolled in Medicare FFS
- 2. Beneficiary is aged 65 years or older
- 3. Beneficiary was discharged from a non-federal acute care hospital
- 4. Beneficiary is transferred to a Skilled Nursing Facility within 1 day of discharge.
- 5. Beneficiary is enrolled in Part A for the 12 months prior to and including the date of the index admission

#### Denominator Exclusions

Excluded from the measure are all admissions for which full data are not available or for which 30-day readmission by itself cannot reasonably be considered a signal of quality of care (i.e., cancer discharges, psychiatric discharges, against medical advice discharges).

- 1. SNF stays where the beneficiary had one or more intervening post-acute care (PAC) admissions (inpatient rehabilitation facility [IRF] or long-term care hospital [LTCH]) which occurred either between the prior proximal hospital discharge and SNF admission or after the SNF discharge, within the 30-day risk window. Also excluded are SNF admissions where the beneficiary had multiple SNF admissions (>1 SNF admit and discharge date in the 30-day risk window) after the prior proximal hospitalization, within the 30-day risk window.
- 2. SNF stays with a gap of greater than 1 day between discharge from the prior proximal hospitalization and the SNF admission.
- 3. SNF stays where the beneficiary did not have at least 12 months of FFS Medicare enrollment prior to the proximal hospital discharge (measured as enrollment during the month of proximal hospital discharge and the for 11 months prior to that discharge).
- 4. SNF stays in which the beneficiary did not have FFS Medicare enrollment for the entire risk period (measured as enrollment during the month of proximal hospital discharge and the month following the month of discharge). Rationale: Readmissions occurring within the 30-day risk window when the beneficiary does not have FFS Medicare coverage cannot be detected using claims.
- 5. SNF stays in which the principal diagnosis for the prior proximal hospitalization was for the medical treatment of cancer. Beneficiaries with cancer whose principal diagnosis from the prior proximal hospitalization was for other diagnoses or for surgical treatment of their cancer remain in the measure.
- 6. SNF stays where the beneficiary was discharged from the SNF against medical advice.

- 7. SNF stays in which the principal primary diagnosis for the prior proximal hospitalization was for "rehabilitation care; fitting of prostheses and for the adjustment of devices."
- Denominator Exceptions and Exclusions Details

Denominator exclusions are identified based on variables contained in the Integrated Data Repository (IDR). For Medicare FFS beneficiaries:

- 1. Lack of enrollment in Medicare FFS for 30 days post-discharge is identified by beneficiary enrollment status; the enrollment indicators must be appropriately marked for the month(s) which falls within 30 days of hospital discharge date.
- 2. Lack of continuous enrollment in Medicare FFS for 12 months prior to index hospital stay is determined by beneficiary enrollment status; the enrollment indicators must be appropriately marked for each of the 12 months prior to the index hospital stay
- 3. Discharges against medical advice are identified using the discharge disposition indicator.
- 4. PPS-exempt cancer hospitals are identified by their Medicare provider number.
- 5. **Table 1** indicates all cancer discharge condition categories excluded from the measure.
- 6. Table 2 indicates all psychiatric discharge condition categories excluded from the measure.
- 7. Admissions for rehabilitation care are identified by principal diagnosis codes (ICD-10 codes) included in AHRQ's Clinical Classification Software category 254

In addition, in-hospital deaths are identified using the discharge disposition vital status indicator in the IDR and transfers to other acute care facilities are identified in the claims when a beneficiary is discharged from an acute care hospital and admitted to another acute care hospital on the same day or next day.

#### **Numerator**

Numerator Statement

This measure is designed to capture the outcome of unplanned all-cause hospital readmissions (IPPS or CAH) of SNF beneficiaries occurring within 30 days of discharge from the beneficiary's prior proximal acute hospitalization. The numerator is more specifically defined as the risk-adjusted estimate of the number of unplanned readmissions that occurred within 30 days from discharge from the prior proximal acute hospitalization.

Numerator Details

The outcome for this measure is unplanned all-cause readmission within 30 days of discharge from a prior proximal hospitalization and admission to a SNF. Because planned readmissions are not a signal of quality of care, the measure does not count planned readmissions in the outcome. The measure uses an algorithm to identify "planned readmissions" in claims data that will not count as readmissions in the measure. The algorithm is based on three main principles:

- 1. A few specific, limited types of care are always considered planned (transplant surgery, maintenance chemotherapy/radiotherapy/ immunotherapy, rehabilitation);
  - 2. Otherwise, a planned readmission is defined as a non-acute readmission for a scheduled procedure; and
  - 3. Admissions for acute illness or for complications of care are never planned.

The algorithm which was originally developed in 2011, and later updated in 2013, to identify planned readmissions uses a flowchart and four tables of specific procedure categories and discharge diagnosis categories to classify readmissions as planned. Readmissions are considered planned if any of the following occurs during the readmission:

- 1. A procedure is performed that is in one of the procedure categories that are always planned regardless of diagnosis (**Table 3**);
- 2. The principal diagnosis is in one of the diagnosis categories that are always planned (Table 4); or

3. A procedure is performed that is in one of the potentially planned procedure categories (**Table 5 and Table 5a**) and the principal diagnosis is not in the list of acute discharge diagnoses (**Appendix A**).

# Stratification or Risk Adjustment

This measure uses risk adjustment and is not stratified. Due to the natural clustering of observations within SNFs, we used hierarchical logistic regression to model the log-odds of readmission for each index SNF stay. Readmission within 30 days was modeled as a function of beneficiary-level demographic and clinical characteristics and a random SNF-level intercept. This model specification accounts for within-SNF correlation of the observed outcomes and assumes that underlying differences in quality among the SNF facilities being evaluated lead to systematic differences in outcomes.

The risk adjustment model for the SNFRM accounts for variation across SNFs in case-mix and beneficiary characteristics predictive of readmission using a hierarchical logistic regression model. The goal of risk adjustment is to account for differences across SNFs in beneficiary demographic and clinical characteristics that might be related to the outcome but are unrelated to quality of care. For this reason, we have to take beneficiary frailty (case mix) into account by including primary diagnosis and comorbidities in our models. In addition, we included demographic variables (age and sex), and other health service factors such as length of stay during the beneficiary's prior proximal hospitalization, whether the beneficiaries were in the intensive care unit (ICU), and number of previous hospitalizations in the previous 365 days.

To capture beneficiaries' primary reason for their prior proximal hospitalization, we aggregated the principal discharge diagnosis and all the procedures from the prior proximal hospitalization using the Agency for Healthcare Research and Quality (AHRQ) Clinical Classification System (CCS) single-level codes. The CCS collapses ICD-10-CM and ICD-10-PCS codes from the International Classification of Diseases, 10th Revision, Clinical Modification (ICD-10-CM) into a clinically meaningful, mutually exclusive set of condition categories and procedure categories.

Our model controls for 198 primary conditions using the AHRQ CCS grouper and two additional groupings—one that summed over 29 CCS categories with few beneficiaries in each that increased readmission risk and another that summed over 5 CCS categories with few beneficiaries that decreased readmission risk. We also included 72 comorbidities grouped using CMS' hierarchical condition categories (HCCs) in our models.

### Covariates used in models:

- Age
- Sex
- Length of stay during prior proximal hospitalization
- Any time spent in the intensive care unit (ICU) during the prior proximal hospitalization
- Disabled as a reason for Medicare coverage
- End-stage renal disease (ESRD)
- Number of acute care hospitalizations in the 365 days prior to the prior proximal hospitalization
- Principal diagnosis as categorized using AHRQ's single-level CCS
- System-specific surgical indicators
- Individual comorbidities as grouped by CMS' hierarchical condition categories (HCCs) or other comorbidity indices
- Presence of multiple comorbidities, modeled using two variables: (a) the count of HCCs if count is >2 and (b) the square of this count of HCCs

# **Calculation Algorithm**

Step one: Identify beneficiaries meeting the denominator criteria.

Step two: Identify beneficiaries meeting the numerator criteria taking into account the planned readmission algorithm.

We identify the SNF readmission measure 30-day risk window starting from the prior proximal hospitalization discharge date. If the readmission occurred during the SNF stay within the 30-day risk window or after the SNF stay but still within the 30-day risk window, and is not a planned admission, it is counted in the numerator.

Step three: Identify presence or absence of risk adjustment variables for each beneficiary.

Step four: Calculate the predicted and expected number of readmissions for each SNF using the hierarchical logistic

regression model. The predicted number of readmissions for each SNF is calculated as the sum of the predicted probability of readmission for each beneficiary in the facility, including the SNF-specific (random) effect. The numerator of the SRR ("predicted") is the number of readmissions for beneficiaries within 30 days

predicted on the basis of the ACO's performance with its observed case mix, and the denominator

("expected") is the number of readmissions expected for beneficiaries on the basis of the overall performance with that ACO's case mix. This approach is analogous to a ratio of "observed" to "expected" used in other types of statistical analyses. It conceptually allows for a comparison of a particular ACO's performance given its case-mix to an average ACO's performance with the same case-mix. Thus, an SRR less than 1 indicates lower-than-expected readmission or better quality and an SRR greater than 1 indicates higher-than-expected

readmission or worse quality.

Step five: Calculate the risk-standardized SNF 30-day readmission rate (RSRR). Begin with the SRR, obtained above, and

multiply it by the overall national raw readmission rate (using data in Step 2) for all SNF stays to produce the

risk-standardized readmission rate (RSRR).

NOTE: Because the statistic described in Step five is a complex function of parameter estimates, re-sampling and simulation techniques (e.g., bootstrapping) are necessary to derive a confidence interval estimate for the final risk-standardized rate, to characterize the uncertainty of the estimate.
