Administration of GLOFITAMAB

Centers for Medicare & Medicaid Services
ICD-10 Coordination and Maintenance Committee Meeting
March 7-8, 2023

GLOFITAMAB is a T-cell-engaging bispecific antibody for the treatment of patients with relapsed/refractory (R/R) diffuse large B-cell lymphoma (DLBCL) who have received ≥ 2 prior systemic therapies

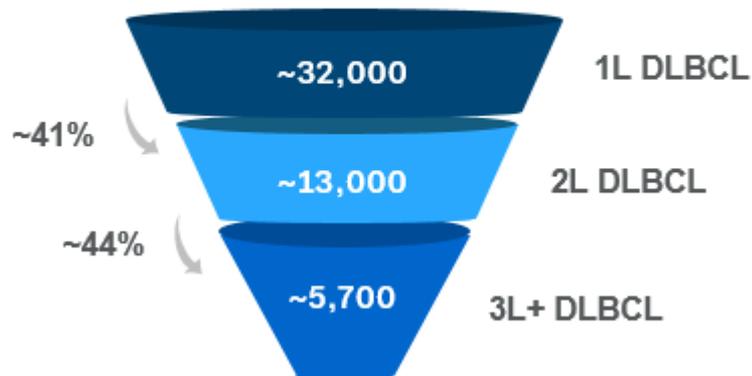

- **GLOFITAMAB** is the international, non-proprietary name* for the technology under consideration
- **Bispecific antibody** with a **novel 2:1 structure** designed to enable high-avidity, bivalent targeting of **CD20** on the surface of **B cells** and concomitant monovalent binding to **CD3** on **T cells**
- GLOFITAMAB induced **durable response rates** that were maintained after cessation of therapy with a **manageable safety** profile in an area of high unmet **medical need**
- **Off the shelf**, fixed-duration therapy administered as an **intravenous infusion (IV)**
- In the inpatient setting, GLOFITAMAB will be documented in the “**medication administration**” section of the medical record
- **Under consideration by CMS for an NTAP for FY2024**

* Subject to Food and Drug Administration (FDA) approval, the trade name for the product GLOFITAMAB will be finalized

DLBCL IS THE MOST COMMON FORM OF NHL AND IS PRIMARILY A DISEASE OF OLDER PEOPLE

DLBCL is the most common form of NHL¹

Estimated Treatment-Eligible DLBCL Cases in the US²

Patients with 3L+ DLBCL are heavily pretreated and highly refractory; many have exhausted all available treatment options. This is a patient cohort with substantial unmet clinical need

- DLBCL is an **aggressive** and **rapidly progressing** disease that involves the **malignant proliferation of B lymphocytes or B cells**^{1,3}
- Median age of diagnosis is **66 years**^{1,4}
- The rate of **new cases of DLBCL is 5.6 per 100,000** people per year; the death rate is **1.8 per 100,000** people per year^{a,4}
- The **5-year relative survival is 64.6%**⁴

- The incidence of DLBCL cases in the US is approximately 30,000 new cases per year and is projected **to increase by 11% from 2020 to 2025** as a result of the aging population and the underlying higher incidence rate of DLBCL with older age²

^aRates are age-adjusted and based on 2015-2019 cases and deaths.

1L, first line; 2L, second line; 3L+, third line and greater; DLBCL, diffuse large B-cell lymphoma; NHL, non-Hodgkin lymphoma; US, United States.

4. National Cancer Institute. NHL—diffuse large B-cell lymphoma. SEER 2022.

THE PROGNOSIS IS POOR FOR PATIENTS WHO DO NOT ACHIEVE SUSTAINED REMISSION WITH FIRST-LINE (1L) R-CHOP

Approximately 40% of Patients Will Require R/R Treatment

- Approximately 60% of patients will achieve long-term remission with R-CHOP¹⁻⁴
- Of the remaining 40%, approximately 10% to 15% will have primary refractory disease and 20% to 25% will relapse, usually within the first 2 years of treatment¹⁻⁴

Eligibility and Access to Curative Therapies Are Limited

- Approximately half of patients seeking 2L therapy are not eligible for ASCT or CAR T-cell therapy due to advanced age, comorbidities and/or the ability to tolerate treatment.¹
- ASCT and CAR T-cell therapies are only available at a limited number of specialized/authorized centers that may require extensive patient travel and long wait times for CAR T-cell manufacturing slots⁵⁻¹⁰

Poor Duration of Response

- Median survival of patients who receive 2L treatments ranges from 10-12 months^{2,11-13}
- Patients who initiate 3L treatment have a median overall survival of about 4-6 months¹⁴

Grade ≥3 NEs, %	32	21	10	4	11

Patient populations in these trials may be significantly different so this table is not intended to suggest cross-trial comparison

Limitations of CAR T-cell therapy

- Long waiting periods to access manufacturing slots
- 12 states have no available CAR T-cell sites
- Relocation near treatment site for 4 weeks after infusion
- Advised driving restriction for at least 8 weeks
- Poor tolerability, especially in older patients and patients with comorbidities
- High rates of CRS
- Potential for severe neurotoxicity
- Requires chemotherapy lymphodepletion

There is an unmet need for more options that offer durable efficacy with a manageable safety in R/R DLBCL

^aUnderstanding of data from CAR T-cell studies evolved over time. Data are based on recent review authored by the lead investigators from ZUMA-1, TRANSCEND, and JULIET.¹

GLOFITAMAB IS A T-CELL-ENGAGING BISPECIFIC ANTIBODY WITH A NOVEL 2:1 STRUCTURE

GLOFITAMAB is a bispecific antibody with a novel 2:1 structure designed to enable high-avidity, bivalent targeting of CD20 on the surface of B cells and concomitant monovalent binding to CD3 on T cells

- Binding to **CD3** activates the T cell, which **induces T-cell proliferation** and **targeted killing of B cells** ¹
- The **novel 2:1 structure** enables high-avidity, bivalent binding to CD20 that can result in activity against malignant B cells even under low effector-to-target cell ratios^{2,3}
- The half-life is maintained due to the **intact Fc region**, allowing for a relatively simple dose schedule

GLOFITAMAB will be used to treat patients with R/R DLBCL who have progressed after ≥2 prior lines of therapy

¹Obinutuzumab binds to the same CD20 epitope as GLOFITAMAB.

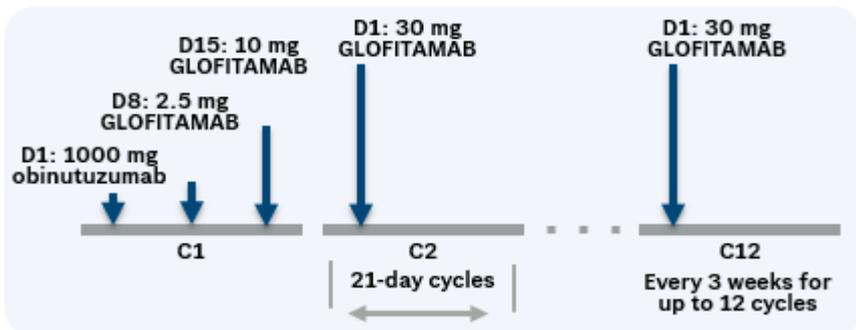

CD3, cluster of differentiation 3; CD20, cluster of differentiation 20; DLBCL, diffuse large B-cell lymphoma; Fc, fragment crystallizable; R/R, relapsed/refractory.

NCT03075696: A DOSE EXPANSION STUDY OF GLOFITAMAB AS A SINGLE AGENT AND IN COMBINATION WITH OBINUTUZUMAB IN R/R DLBCL¹

GLOFITAMAB administration

- **Simple dose schedule and fixed-duration therapy**
- Obinutuzumab is administered on the first day of cycle 1, followed by 2.5 mg of glofitamab on Day 8 and 10 mg of glofitamab on day 15 of cycle 1. These measures are to reduce the risk of CRS
- Following cycle 2, glofitamab is given on day 1 of every subsequent cycle. Each cycle is 21 days
- The maximum number of cycles is 12. Treatment can be completed to 8.5 months

Key inclusion criteria

- DLBCL (DLBCL NOS, HGBCL, transformed FL or PMBCL)
- ECOG PS 0-1
- ≥ 2 prior regimens, including at least 1 anti-CD20 Ab and 1 anthracycline

Primary objective

- CR (best response) rate by PET/CT assessed by an independent review committee²

Baseline characteristics (N=155)

- Median age: 66 years (range, 21-90)
- Stage III–IV disease: 75.3%
- Median number of prior lines: 3 (range, 2–7)
 - 2 prior lines: 40.3%
 - ≥ 3 prior lines: 59.7%
- Prior CAR T-cell therapy: 33.1%
 - Refractory to CAR T-cell therapy: 90.2%
- Refractory to any prior therapy: 90.3%
- Refractory to last therapy: 85.7%

GLOFITAMAB MET ITS PRIMARY ENDPOINT IN HEAVILY PRETREATED PATIENTS WITH DLBCL, WHERE THE MAJORITY ARE HIGHLY REFRACTORY

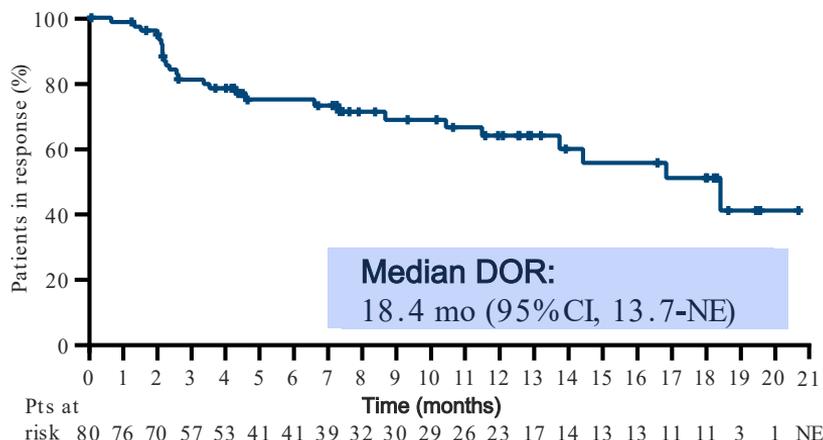

Efficacy endpoint	GLOFITAMAB 2.5/10/30 mg (N=155)
CR rate, ^a n (%)	<p style="text-align: center;">61 (39.4%) [95% CI, 31.6-47.5]</p>
ORR, ^a n (%)	<p style="text-align: center;">80 (51.6%) [95% CI, 43.5-59.7]</p>
<ul style="list-style-type: none"> • Median duration of follow-up: 12.6 months (range, 0-22) • Responses were achieved early: median time to first CR was 42 days (95% CI, 42-44) 	
<p style="text-align: center;">Patients achieved a similar CR rate regardless of having 2 or ≥3 prior lines of therapy, being younger or older than 65 years, or having prior CAR T-cell therapy</p>	

^aBest response by intent-to-treat population.

CAR, chimeric antigen receptor; CI, confidence interval; CR, complete response; DLBCL, diffuse large B-cell lymphoma; IRC, independent review committee; ORR, overall response rate; R/R, relapsed/refractory. Dickinson M, et al. ASCO 2022. Oral 7500.

Grade 4	2 (1.3)
Median time to CRS onset from C1D8 dose, hours (range)	13.6 (6.2-51.8)
Median CRS duration, hours (range)	30.63 (0.5-316.7)
Corticosteroids for CRS management	27/97 (27.8)
Tocilizumab for CRS management	31/97 (32.0)
Neurologic AEs (all grades) ^b	59 (38.3)
Grade ≥ 3	5 (3.2)
ICANS (all grades) ^c	12 (7.8)
Grade ≥ 3	4 (2.6)

^aCRS was graded by investigator according to Lee 2014 criteria (and grade by the ASTCT criteria was derived based on reported data). ^bNeurologic AEs include AEs reported in Nervous System Disorders and Psychiatric Disorders System Organ Class. ^cNeurologic AEs potentially consistent with ICANS. ^dOne patient had grade 1 CRS following obinutuzumab pretreatment due to CAR T-cell re-expansion. AE, adverse event; ASTCT, American Society for Transplantation and Cellular Therapy; C, cycle; CAR, chimeric antigen receptor; CRS, cytokine release syndrome; D, day; ICANS, immune effector cell-associated neurotoxicity syndrome. Dickinson M, et al. ASCO 2022. Oral 7500.

GLOFITAMAB DEMONSTRATED CLINICALLY MEANINGFUL OUTCOMES WITH A MANAGEABLE SAFETY PROFILE IN R/R DLBCL

T-Cell-Engaging Bispecific Antibody

- GLOFITAMAB is a T-cell-engaging bispecific monoclonal antibody that demonstrated clinically meaningful outcomes for patients with 3L+ DLBCL in a pivotal phase II setting
 - Patients in the pivotal cohort were heavily pretreated (40.3% with 2 prior lines and 59.7% with ≥ 3 prior lines) and highly refractory (90.3% refractory to any prior therapy)
 - Approximately one-third of the patients had prior CAR T-cell therapy, and 90.2% of those patients were refractory to CAR T-cell therapy

Clinically Meaningful Responses

- The CR rate was 39.4% in this difficult-to-treat patient population
 - CRs were achieved early (median time to response: 42 days) and were durable (mDOR: not estimable; 12-month DOCR: 77.6%)

Manageable Safety Profile

- GLOFITAMAB was well tolerated with a low rate of treatment discontinuations (9.1%)
 - The most frequent AE was CRS, with the majority being grade 1 (fever) and occurring on the initial dose

Fixed-Duration Therapy

- GLOFITAMAB is a promising off-the-shelf therapy, with a simple and fixed-duration dosing schedule (every 3 weeks for a maximum of 12 cycles). Treatment can be completed in up to 8.3 months
