1 INPUTS

Table 1: Clinical Episode Reconciliation Inputs

#	Name	Description
1	BPCI Advanced National and Participant Performance Period Clinical Episodes	The national and Participant set of Clinical Episodes and associated spending amounts in the Performance Period.
2	Final Target Prices	Prices finalized at the time of Reconciliation by replacing the preliminary Patient Case Mix Adjustment (PCMA) with the realized value, the preliminary Relative Case Mix with the updated Relative Case Mix, ¹ and updating the prices using the retrospective trends capped at 10% (a.k.a the capped PGT Factor Adjustment) in the Performance Period.
3	Quality Measures Data	Individual Quality Measure scores used to calculate Composite Quality Score (CQS) for each Episode Initiator.
4	Master Data Management (MDM)	These data are used as an input to identify beneficiaries aligned to Accountable Care Organizations (ACOs) and other CMMI models to be excluded from BPCI Advanced.

¹ Please note that only the numerator in the Relative Case Mix term is updated during the Performance Period.

2 OUTPUTS

Table 2: Clinical Episode Reconciliation Outputs

#	Name	Description
1	Net Payment Reconciliation Amount (NPRA)	The amount paid to the Participant by CMS after the Reconciliation.
2	Repayment Amount	The amount paid by the Participant to CMS after the Reconciliation.
3	Excess Spending Amount	The amount paid by the Participant to CMS after Post-Episode Spending Calculations.

3 CLINICAL EPISODE RECONCILIATION OVERVIEW

The following document describes the specifications used for semi-annual Reconciliation calculations and Post-Episode Spending Calculations for the Bundled Payments for Care Improvement Advanced (BPCI Advanced) model. This document is based on the methodology and outputs from the previous steps of the model that are discussed in the Clinical Episode construction² and Target Price construction³ specifications documents. To refer to specific steps from the Clinical Episode construction and Target Price construction specifications, this document uses **CE-Step** and **TP-Step**, respectively.

As part of the Reconciliation process, for each Participant (both Convener Participants and Non-Convener Participants) CMS compares the Medicare Fee-For-Service (Medicare FFS) allowed amounts from the Episode Initiator's Clinical Episodes against final Target Prices and identifies payments above or below the final Target Price by the defined amount. After applying payment adjustments and capping amounts to limit risk exposure, defined amounts are represented by either the *Net Payment Reconciliation Amount (NPRA)* (the amount paid to the Participant by CMS) or the *Repayment Amount* (the amount paid by the Participant to CMS). In addition to calculating Reconciliation amounts, CMS performs true-up calculations to update initial Reconciliation amounts and prior true-ups using claims processed as of a later date, and quality adjustments, where applicable. Finally, for each Participant, CMS performs a Post-Episode Spending Calculation that determines whether aggregate Medicare FFS spending on items and services furnished to BPCI Advanced Beneficiaries during the Post-Episode Spending Monitoring Period exceeds a calculated threshold in order to prevent excess spending in the days following the Clinical Episode period.

Figure 1 contains the timeline for the sequential stages of the Reconciliation process for Performance Periods 5, 6, and 7.⁴ For example, for Participants with Clinical Episodes ending between January 1, 2021 and June 30, 2021 (Performance Period 5), CMS will conduct the initial Reconciliation in Fall 2021, and first and second true-up calculations in Spring 2022 and Fall 2022, respectively. Additionally, Model Year 4 Clinical Episodes that end in CY2022 will be reconciled and “trued-up” on the same schedule as the first Reconciliation in Model Year 5 (Performance Period 7). Target Price assignment is determined using Anchor Stay discharge or Anchor Procedure completion date, and Performance Period is determined using Clinical Episode end date. Quality adjustments based on the Composite Quality Score (CQS) will be first applied during the second true-up calculations for Performance Period 5, the first true-up calculations for Performance Period 6 and the initial Reconciliation calculation for Performance

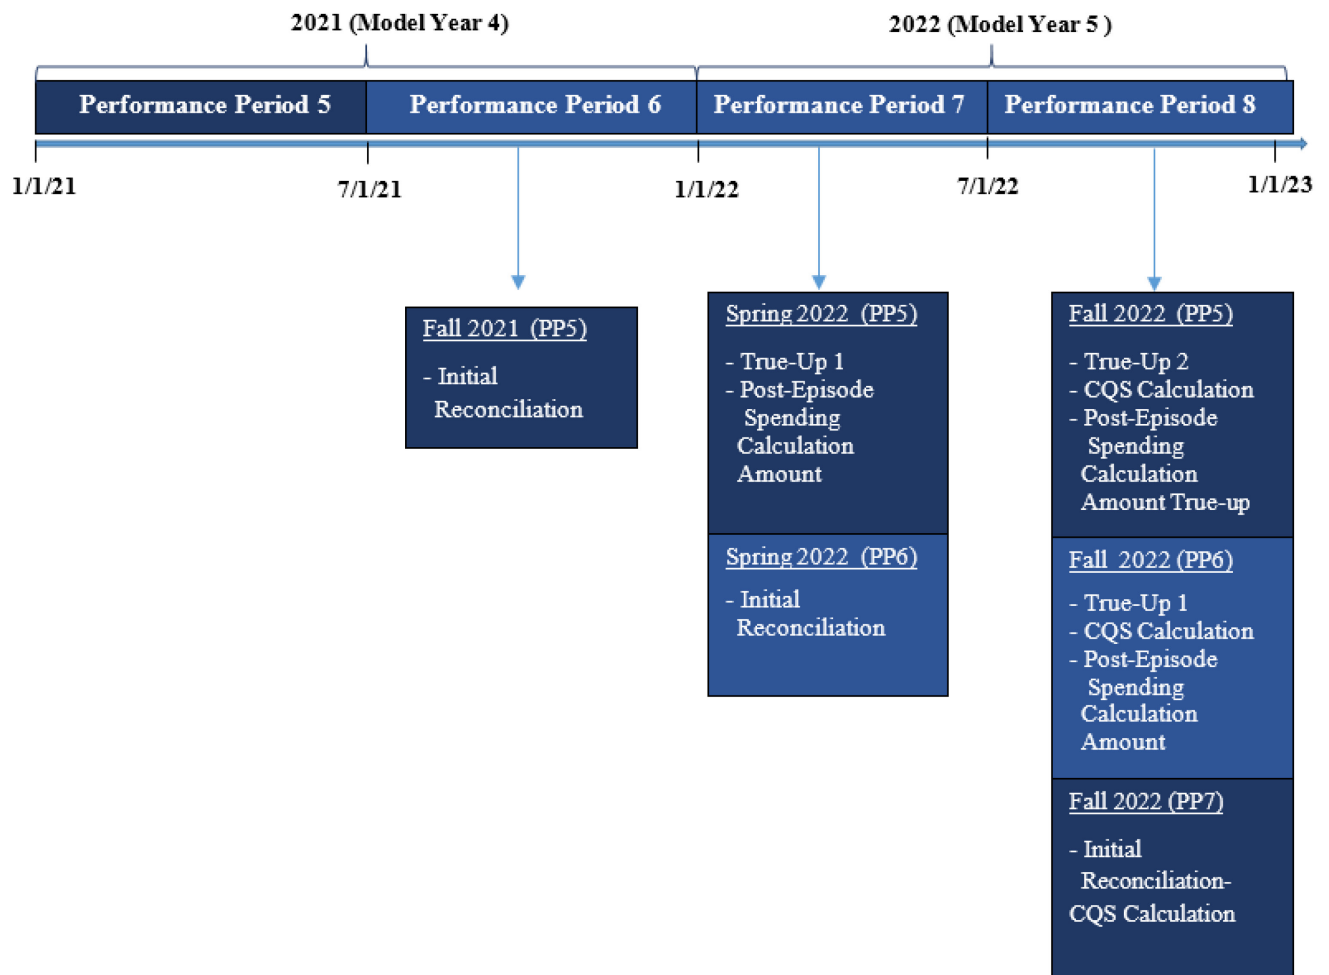

² Please refer to the MY4 Clinical Episode Construction Specifications on the Participant Portal: <https://app.innovation.cms.gov/bpciadv/IDMLLogin>

³ Please refer to the MY4 Target Price Specifications on the Participant Portal: <https://app.innovation.cms.gov/bpciadv/IDMLLogin>

⁴ Refer to Table 3 for date ranges of each Performance Period in Model Year 4.

Period 7 (Fall 2022). Post-Episode Spending Calculations will initially occur during the first true-up calculation of each Performance Period and will be recalculated during the second true-up.

Figure 1. Reconciliation Timeline

The next 7 sections contain detailed descriptions of the sequential stages of the Reconciliation process.

- **Section 4** provides the methodology for calculating Performance Period Clinical Episode payments in real dollars.
- **Section 5** discusses the methodology for calculating final Target Prices using the updated PCMA, the updated Relative Case Mix, and the capped PGT Factor Adjustment.

- **Section 6** provides the methodology for calculating Total Performance Period Target Amounts for each Episode Initiator.
- **Section 7** describes quality measures and provides detailed methodology for the calculation and implementation of CQS.
- **Section 8** describes the step-by-step calculation of Reconciliation amounts.
- **Section 9** walks through semi-annual true-up calculations.
- **Section 10** introduces BPCI Advanced Post-Episode Spending Calculations.

4 CALCULATE PERFORMANCE PERIOD CLINICAL EPISODE PAYMENTS

This section describes steps to calculate Performance Period Clinical Episode payments for each Episode Initiator and Clinical Episode Category, using the Performance Period Clinical Episodes with the date ranges detailed in Table 3.

Table 3: Model Year 4 Clinical Episode Date Ranges

Performance Periods	Date Range
Performance Period 5	Clinical Episodes with a Clinical Episode end date between 1/1/2021 and 6/30/2021 and an Anchor Stay discharge date or Anchor Procedure completion date on or after 1/1/2021. ^{5,6}
Performance Period 6	Clinical Episodes with a Clinical Episode end date between 7/1/2021 and 12/31/2021. ⁷
Performance Period 7	Clinical Episodes with a Clinical Episode end date on or after 1/1/2022, but an Anchor Stay discharge date or Anchor Procedure completion date on or before 12/31/2021. ⁸

⁵ When a Participant terminates participation in the Model, the Participant will be accountable for Clinical Episodes if the Anchor Stay/Anchor Procedure discharge/completion date is prior to the effective date of the termination. Performance Period attribution will be based on Clinical Episode end date.

⁶ Clinical Episodes with an Anchor Stay discharge date or Anchor Procedure completion date during Calendar Year (CY) 2020 and Clinical Episode end dates during CY2021 will be considered MY3 Clinical Episodes. If a Participant is active in the Clinical Episode Category for the first time in MY4 as a result of the Clinical Episode Service Line Group, then in the Performance Period, the Participant will not be attributed any MY4 Clinical Episodes that had Clinical Episode start dates prior to the start of MY4.

⁷ Refer to footnote 5.

⁸ For purposes of Target Price and Clinical Episode construction, Clinical Episodes with a Clinical Episode end date on or after 01/01/2022 and an Anchor Stay discharge date or Anchor Procedure completion date on or after 01/01/2022 are not identified as MY4 Clinical Episodes and are identified as MY5 Clinical Episodes.

- **Step 1. Aggregate Performance Period Clinical Episode payments at the Episode Initiator-Clinical Episode Category level:** Use the BPCI Advanced Participant Clinical Episodes ending in the applicable Performance Period to calculate each Episode Initiator’s total spending for a particular Clinical Episode Category.⁹ Specifically, for each Episode Initiator, sum the standardized allowed amounts across all the Clinical Episodes in that Clinical Episode Category. If the Episode Initiator is an Acute Care Hospital (ACH), aggregate spending for all Clinical Episodes initiated and attributed to the ACH. If the Episode Initiator is a Physician Group Practice (PGP), aggregate spending for all attributed Clinical Episodes based upon initiating claims billed under the PGP’s TIN, as described in the Clinical Episode Construction Specifications.¹⁰
- **Step 2. Convert Performance Period Clinical Episode payments to real dollars to obtain final Performance Period Clinical Episode payments:** Convert the Performance Period Clinical Episode payments to real dollars using the following steps:
 - **Step 2a.** Create a ratio of real dollars to standardized dollars by dividing the sum of real Clinical Episode payments by the sum of standardized Clinical Episode payments in the Performance Period for each Episode Initiator and Clinical Episode Category.
 - **Step 2b.** Multiply the Performance Period Clinical Episode payments (**Step 1**) by the ratio of real dollars to standardized dollars calculated in **Step 2a**.

⁹ COVID-19 adjuvants will be excluded from Performance Period Clinical Episode payments that meet the following criteria: (i) drug HCPCS codes that correspond to COVID-19 adjuvants that are used to treat COVID-19 but were already on the market prior to COVID-19 and are clinically reviewed and (2) drug HCPCS codes that correspond to drugs and/or vaccines approved solely for COVID-19 and are clinically reviewed. CMS will publish the list of excluded COVID-19 HCPCS ahead of each Reconciliation cycle.

¹⁰ $Performance\ Period\ Clinical\ Episode\ Payments_{m,ce,t} = \sum_{h \in H} \sum_{i \in T(m,h,ce,t)} Y_{i,m,t}$

where:

i is the specific Clinical Episode

h is the ACH at which the Clinical Episode is initiated

t is the applicable Performance Period

m is the Episode Initiator which can be either an ACH or PGP

ce is the specific Clinical Episode Category

$Y_{i,m,t}$ is the standardized Clinical Episode allowed amount

The value $i \in T(m,h,ce,t)$ refers to a Clinical Episode i from the set of Clinical Episodes initiated by an Episode Initiator m at ACH h at time t . $T(m,h,ce,t)$ will be empty for all $h \in H$ at which the Episode Initiator is not assigned a Clinical Episode.

5 CALCULATE FINAL TARGET PRICE

This section explains how to calculate the final Target Price. The final Target Price methodology updates the preliminary Target Price at the time of Reconciliation by using realized Performance Period data to calculate the updated PCMA and the updated Relative Case Mix. This practice ensures that final Target Prices accurately reflect the case mix of the patients treated during a given Performance Period. The Standardized Baseline Spending (SBS), Peer Group Historical Adjustment (PGHA), and Peer Group Trend (PGT) Factor remain constant from the preliminary Target Price calculation.¹¹ The final Target Price methodology also includes the capped PGT Factor Adjustment (PGT_Adj) to ensure the maximum difference between prospective and realized peer group trend is 10%. Thus, for ACHs, the updated Hospital Benchmark Price (HBP) is calculated by updating the PCMA term, using the following equation:

$$HBP_h^u = SBS_h * PCMA_h^u * PGHA_h * PGT_h * PGT_Adj_h$$

where h is the ACH to which the Clinical Episode is attributed, and u denotes that the term is the updated version.

For PGP Episode Initiators, the updated PGP-ACH Benchmark Price is calculated by updating the Relative Case Mix term so that it compares the Performance Period case mix of the PGP's Clinical Episodes at the ACH, to the baseline period case-mix of the ACH's episodes. The final PGP-ACH Benchmark Price is calculated using the following equation:

$$PGP\ ACH\ Benchmark\ Price_{p,h}^u = HBP_h^i * PGT_Adj_h * Relative\ Case\ Mix_{p,h}^u$$

where p is the PGP to which the Clinical Episode is attributed;

h is the ACH at which the Clinical Episode is initiated;

i denotes that the term is the preliminary version;

u denotes that the term has been updated to reflect realized Performance Period spending;

and PGT_Adj is the capped PGT Factor Adjustment

The formulas above use components of preliminary Target Prices that are updated each Model Year to account for the most recently available Medicare payment rates. Specifically, the preliminary Target Prices for Model Year 4 are updated two times to align with updates to Medicare FFS payment rates. The preliminary Target Prices distributed in October 2020 were based upon the FY2020 and CY2020 Final Rules. The preliminary Target Prices distributed in

¹¹ Though the Medicare payment rate updates will impact the SBS, PGHA, and PGT, any resulting changes to the Target Price will be delivered to Participants prospectively and therefore will be a part of the Preliminary Target Price.

March 2021 reflect FY2021 and CY2021 payment rate updates and are applicable to episodes with anchor end dates in 2021Q1-Q3. The preliminary Target Prices distributed in December 2021 reflect FY2022 and CY2021 payment rate updates and are applicable to episodes with anchor end dates in 2021Q4. The goal of these updates is to maintain an accurate benchmark against which the Model compares Aggregate FFS Payments (AFP). While the group of baseline period Clinical Episodes remains the same, the revised payment rates are used to inflate the spending amounts of these baseline period Clinical Episodes to current Medicare payment rates. Risk adjustment is rerun under specifications identical to the initial preliminary Target Prices. This results in updated coefficients and, ultimately, updated preliminary Target Prices. The changes to pricing only reflect changes to the relevant prices finalized in the Final Rules. Since, on average, rates increase, it is anticipated that these updates will on average increase preliminary Target Prices. These new preliminary Target Prices are provided to Participants as soon as feasible following publication of the applicable Final Rules in the Federal Register. Refer to Table 4 below for dates and payment rate periods pertaining to the updates.

Table 4: Preliminary Target Price Updates

Preliminary Target Price Estimated Release Date	Preliminary Target Price Effective Date	Applicable FFS Payment Rate Period ¹²
October 2020	N/A	FY2020 and CY2020 ¹³
March 2021	January 1, 2021	FY2021 and CY2021
December 2021	October 1, 2021	FY2022 and CY2021

These preliminary Target Prices, adjusted for the new Medicare payment rates, will be converted to final Target Prices using the steps described below.

- **Step 3. Determine updated HBP:** To ensure that Target Prices accurately reflect the case mix of the patients treated during a given Performance Period, update the preliminary HBP (**TP-Step 13**) to take into account the realized case mix of the Performance Period that has now ended for each ACH and Clinical Episode Category. This requires recalculating the Clinical Episode level patient case mix adjustment amount that comes from the predicted values of the first stage of the risk adjustment model and adjusting the PCMA term and the HBP to account for the updates. This step does not involve rerunning the risk adjustment models.
 - **Step 3a.** For an ACH, apply the beneficiary-level coefficient values from **TP-Step 2** to the Clinical Episodes in the Performance Period. Specifically, rerun **TP-Step 3**

¹² Fiscal year payment rate updates will incorporate changes in the Inpatient Prospective Payment System (IPPS), Inpatient Rehabilitation Facility (IRF) and Skilled Nursing Facility (SNF) Final Rules. Calendar year update will incorporate changes in the Outpatient Prospective Payment System (OPPS), Physician Fee Schedule (PFS) and Home Health Agency (HHA) Final Rules. The calendar year updates will also incorporate Medicare Economic Index (MEI).

¹³ Initial preliminary Target Prices are based on the 2020 payment rates due to availability at the time of workbook distribution.

using the Performance Period Clinical Episodes to calculate the Clinical Episode-level patient case mix adjustment amount.

- **Step 3b.** Rerun **TP-Step 10** to calculate the updated PCMA for the ACH and Clinical Episode Category by taking the average Clinical Episode-level patient case mix adjustment amount (**Step 3a**) and dividing by the Average Observed Clinical Episode Spending (**TP-Step 7**). The Average Observed Clinical Episode Spending is a normalizing factor that is used to interpret the SBS in dollars and the PCMA terms as ratios relative to national baseline case mix. It is calculated by taking the average predicted spending for all Clinical Episodes in the national set of Clinical Episodes for a Clinical Episode Category, and it remains unchanged from preliminary Target Price construction.
- **Step 3c.** Calculate the capped PGT Factor Adjustment (**TP-Step 19**) by creating a modified version of the updated PCMA term that accounts for the patient case mix among all final Performance Period Clinical Episodes initiated at the ACH, rather than among Performance Period Clinical Episodes attributed to the ACH. Multiply the modified updated PCMA with the ACH's PGHA, PGT, SBS, and count of Performance Period Clinical Episodes in the national set after overlap resolution, that were initiated at the ACH. Take the sum of this product over all ACHs in the peer group. Divide the total Performance Period Clinical Episode spending summed across all Clinical Episodes initiated at eligible ACHs within each peer group by the summed value above. This ratio is the PGT Factor Adjustment. Cap the PGT Factor Adjustment at 10% so that the maximum difference between the prospective peer group trend and realized peer group trend is 10%. This is the capped PGT Factor Adjustment. Clinical Episode Category-Peer Groups with inadequate volume receive a modified PGT Factor Adjustment that effectively replaces the participating ACH's retrospective peer group trend with the national retrospective trend for that Clinical Episode Category.¹⁴
- **Step 3d.** Rerun **TP-Step 13** by multiplying the five components that make up the updated HBP: the SBS (**TP-Step 9**), the modified version of the updated PCMA, the PGHA (**TP-Step 11**), the PGT Factor (**TP-Step 12**), and the capped PGT Factor Adjustment (**Step 3c**) for each ACH and Clinical Episode Category.
- **Step 4. Determine updated PGP-ACH Benchmark Price:** Calculate the updated PGP-ACH Benchmark Price for each Clinical Episode Category by taking into account the PGP's realized case mix at the ACH during the Performance Period that has now ended.

¹⁴ Inadequate volume is defined as a peer group only having 1 ACH or less than or equal to 10 Clinical Episodes during the Performance Period.

- **Step 4a.** Rerun **TP-Step 14** to calculate the updated Relative Case Mix using Performance Period Clinical Episodes. Calculate the updated PCMA at the PGP-ACH level by taking the average Clinical Episode-level patient case mix adjustment amount (**Step 3a**) for each PGP-ACH¹⁵ combination and dividing by the Average Observed Clinical Episode Spending (**TP-Step 7**). Calculate updated Relative Case Mix as the ratio of the final PCMA for each PGP-ACH pair over the preliminary PCMA for the applicable ACH (**TP-Step 10**).
- **Step 4b.** Calculate the updated PGP-ACH Benchmark Price as the product of the preliminary HBP (**TP-Step 13**) capped PGT Factor Adjustment (**Step 3c**), and the updated Relative Case Mix (**Step 4a**).
- **Step 5. Determine final Target Prices:** Calculate the final Target Prices by applying the CMS Discount Factor and converting the price from standardized to real dollars.
 - **Step 5a.** Apply a 3% CMS Discount Factor (**TP-Step 16**) to updated HBPs and updated PGP-ACH Benchmark Prices to calculate the updated Target Prices in standardized dollars for ACHs and PGPs, respectively.
 - **Step 5b.** Calculate final Target Prices by converting the updated Target Prices (**Step 5a**) into real dollars. Multiply the updated Target Prices by a ratio of real dollars to standardized dollars (**Step 2b**) for each Episode Initiator and Clinical Episode Category.

¹⁵ Limited to ACHs at which the PGP initiates Clinical Episodes that are assigned to it. Only those ACHs which have at least 41 Clinical Episodes for that Clinical Episode Category in the baseline period are considered.

6 CALCULATE TOTAL PERFORMANCE PERIOD TARGET AMOUNT

This section describes how to calculate the Total Performance Period Target Amount based upon the final Target Prices for each of the Episode Initiator's Clinical Episode Categories. For ACHs and PGPs practicing at a single ACH, the Total Performance Period Target Amount for each Clinical Episode Category is the category volume in the Performance Period multiplied by the Target Price. For PGPs that trigger Clinical Episodes at more than one ACH, the calculation accounts for the volume distribution of Clinical Episodes across ACHs at which they are initiated. To apply the PGP-ACH Target Prices to the overall Clinical Episode Category, the PGP's Target Prices are volume-weighted to account for the number of Performance Period Clinical Episodes occurring at each ACH for each Clinical Episode Category.

- **Step 6. Determine Total Performance Period Target Amount:** Multiply final Target Prices by Performance Period Clinical Episode volume for each Episode Initiator and Clinical Episode Category.¹⁶
 - **Step 6a.** Count the number of Clinical Episodes assigned to an Episode Initiator for a specific Clinical Episode Category in the Performance Period. For a PGP that practices across multiple ACHs, count the number of Clinical Episodes at each ACH separately.
 - **Step 6b.** For each Episode Initiator and Clinical Episode Category, multiply the final Target Prices (**Step 5**) by the number of Clinical Episodes in the Performance Period (**Step 6a**). For ACHs or PGPs that initiate Clinical Episodes at a single ACH for the applicable category, the result is the Total Performance Period Target Amount. For PGP Episode Initiators, calculate the Clinical Episode volume-weighted sum of the Target Prices of all the ACHs where the PGP Episode Initiator is attributed Clinical Episodes. The weights are the number of Performance Period Clinical Episodes in a given Clinical Episode Category initiated at each ACH during the Performance Period.

Table 5 provides a sample calculation with fabricated data of Total Performance Period Target Amounts for two ACH (H1000 and H2000) and one PGP (P000) Episode Initiators. The PGP, P000, is attributed Clinical Episodes at only one ACH (H1000) for Clinical Episode

¹⁶ The mathematical expression for the Total Performance Period Target Amount is:

$$\text{Total Performance Period Target Amount}_{m,ce,t} = \sum_{h \in H} \text{Final Target Price}_{m,h,ce,t} * \text{Number of Clinical Episodes}_{m,h,ce,t}$$

where:

Number of Clinical Episodes_{m,h,ce,t} = the sum of all Clinical Episodes in time period T for the given m, h, ce, and t. T(m,h,ce,t) will be empty for all h ∈ H at which the Episode Initiator is not attributed a Clinical Episode.

Category CE1 while it is attributed Clinical Episodes across two ACHs (H1000 and H2000) for Clinical Episode Category CE2.

Table 5: Total Performance Period Target Amount Sample Calculation

Episode Initiator	PGP/ACH	ACH CCN Associated with Initiating Claim	Clinical Episode Category	Performance Period Clinical Episode Count	Step 2a	Step 5		Step 6
					Ratio of Real Dollars to Standardized Dollars	Target Price (Standardized Dollars)	Final Target Price (Real Dollars)	Total Performance Period Target Amount (Real Dollars)
H1000	ACH		CE1	34	1.01	\$24,290	\$24,533	\$834,122
H1000	ACH		CE2	15	1.04	\$18,112	\$18,836	\$282,540
H1000	ACH		CE3	28	0.99	\$53,248	\$52,716	\$1,476,048
H1000	ACH		CE4	45	0.89	\$33,039	\$29,405	\$1,323,225
H1000	ACH		CE5	52	1.11	\$24,722	\$27,441	\$1,426,932
H2000	ACH		CE1	12	1.02	\$20,099	\$20,501	\$246,012
H2000	ACH		CE2	1	1.01	\$37,190	\$37,562	\$37,562
H2000	ACH		CE3	14	0.86	\$17,574	\$15,114	\$211,596
H2000	ACH		CE4	150	0.93	\$21,157	\$19,676	\$2,951,400
P000	PGP	H1000	CE1	15	1.01	\$31,434	\$31,748	\$476,220
P000	PGP	H1000	CE2	7	1.05	\$31,898	\$33,493	\$545,231
P000	PGP	H2000	CE2	10	1.05	\$29,598	\$31,078	\$545,231

Note: Examples are not associated with the fabricated data used in other BPCI Advanced specifications documents. All dollar values are rounded to the nearest dollar and ratios are rounded to two decimal places. For PGPs that initiate Clinical Episodes in the same category across multiple ACHs, Total Performance Period Target Amounts are rolled up to the PGP level. Refer to PGP P000 CE2 for an example.

7 CALCULATE COMPOSITE QUALITY SCORE

An important feature of BPCI Advanced is the use of quality performance data to adjust Reconciliation amounts for Participants. By tying payment to performance on quality measures, CMS aims to incentivize providers to improve quality of care while improving efficiency. In MY4, Participants can select either the Administrative Quality Measure Set or the Alternate Quality Measure Set for each Clinical Episode Category they are participating in. For each Clinical Episode Category and Episode Initiator, quality measures based on Participant selections are weighted to calculate the Composite Quality Score (CQS) and CQS Adjustment Amount, which is then applied to the Negative/Positive Total Reconciliation Amounts during true-up calculations to calculate the Adjusted Negative/Positive Total Reconciliation Amount for each Episode Initiator. Using the quality measurement data that are calculated once per year, the CQS Adjustment Amount for Model Year 4 will be applied in Fall 2022 true-up and continue to be incorporated in any subsequent true-ups for a given Performance Period. The following subsections introduce the BPCI Advanced quality measures and provide the step-by-step methodology for calculating the CQS and CQS Adjustment Amount. Data shown throughout this section are fabricated to illustrate CQS calculations.¹⁷

7.1 Quality Measures

CMS selected Administrative and Alternate Quality Measure sets to ensure quality performance can be assessed across the full range of Clinical Episode Categories offered under the BPCI Advanced model. The Administrative Quality Measure set for MY4 contains the same claims-based measures as those used in MY1&2 and MY3. The Alternate Quality Measure set introduces claims-based and registry-based quality measures tailored to align with each of the specialty-specific Clinical Episodes in the model. Table 6 lists quality measures that have been selected to calculate Episode Initiator level CQS for Model Year 4. CMS may update the list of quality measures for future Model Years.

¹⁷ Fabricated data used in this section are not associated with other fabricated data used throughout the rest of this document or in other BPCI Advanced specifications documents.

Table 6: BPCI Advanced Quality Measures

Quality Measure	Quality Measure Category Abbreviation	Guiding NQF / PSI/QPP # ¹⁸	Hospital/ Episode Initiator Based ¹⁹	MIPS (Y/N)	Applicable Clinical Episode Categories	Applicable Quality Measure
All-cause Hospital Readmission Measure	All-Cause Readmissions	NQF #1789	Hospital Based	Y	<ul style="list-style-type: none"> All Inpatient and Outpatient Clinical Episode Categories 	Administrative and Alternate
Advance Care Plan	ACP	NQF #0326	Episode Initiator Based	Y	<ul style="list-style-type: none"> All Inpatient and Outpatient Clinical Episode Categories 	Administrative and Alternate

¹⁸ Please note that several measures were adapted from NQF-endorsed measures; some of the measure specifications were changed for use in the BPCI Advanced model. NQF has not reviewed or approved the revised measure specifications. Any deviations from these measure specifications will be noted.

¹⁹ This column refers to the level at which the NQF/ PSI measure is calculated. All measures will be applied to all participating Episode Initiators. Where the endorsed measure is hospital-based, the measure is adjusted to apply to the PGP. The NQF-endorsed Perioperative Care measure is physician-based, but it will be adjusted to apply to the hospital. Note that these represent deviations from NQF/PSI specifications.

Quality Measure	Quality Measure Category Abbreviation	Guiding NQF / PSI/QPP # ¹⁸	Hospital/ Episode Initiator Based ¹⁹	MIPS (Y/N)	Applicable Clinical Episode Categories	Applicable Quality Measure

7.2 CQS Calculation²²

For each Episode Initiator, performance on multiple quality measures is combined to calculate the CQS and CQS Adjustment Amount that is applied during true-up calculations to the Negative and Positive Total Reconciliation Amounts.

Quality measures such as Tobacco Use Screening and Cessation Intervention (Tobacco Screening) and Patient Centered Surgical Risk Assessment (Patient-Centered SRAC) have both claims-based and registry-based submissions applicable to different CECs. Each version of the Tobacco Screening and Patient-Centered SRAC measures will be considered one individual component for the CQS calculation and will be weighted based depending on the number of the Episode Initiator’s Clinical Episodes for which the version is relevant. For example, the Tobacco Screening – Registry and Tobacco Screening – Claims will appear as two different QM

²² Please note: The methodology for MY4 CQS calculation is still being finalized. Updates to the MY4 CQS Calculation methodology will be incorporated in future versions of this document.

components for Participants who have selected the Alternate Quality Measure for both Stroke and COPD CECs.

Below is a step-by-step methodology for calculating the CQS:

- **Step 7. Convert Raw Quality Measures into Scaled Scores:** For each quality measure and Episode Initiator, scale the raw score by comparing it to the distribution of raw scores among the cohort in the baseline period for that measure. All ACHs will be referred to as Episode Initiators in the text below, regardless of whether or not they are participating in the BPCI Advanced model.
 - For the hospital-based quality measure categories that were introduced in MY3 and prior, the cohort is the national set of ACHs and the baseline period is CY2018 for Participants that joined the Model in MY1&2, and CY2019 for Participants that joined the Model in MY3.
 - For the hospital-based quality measure categories that are new to MY4, the cohort is the national set of ACHs and the baseline period is CY2020 for all Participants, regardless of MY entry.²³
 - For the Advanced Care Plan and Perioperative Care quality measures, which are Episode Initiator-based, the cohort is the set of Episode Initiators (ACHs and PGPs) that are participating in BPCI Advanced. The baseline period for Participants that joined the Model in MY1&2 includes all Clinical Episodes that have Anchor Stay discharge dates or Anchor Procedure completion dates in the second half of CY2019. The baseline period for Participants that joined the Model in MY3 includes Clinical Episodes that have Anchor Stay discharge dates or Anchor Procedure completion dates in CY2020.
 - There are three new EI-based quality measures that begin in MY4: In-Person Eval Following CIED Implantation, Patient-Centered SRAC, and Tobacco Screening. The baseline period for all Participants, regardless of MY entry, includes all Clinical Episodes that have Anchor Stay discharge dates or Anchor Procedure completion dates in CY2021.
- **Step 7a:** Assign the Episode Initiator a scaled score equal to the percentile to which the Episode Initiator's raw score would have belonged in the baseline period. If the raw score could have belonged to either of two percentiles, assign the higher one. If an Episode Initiator has a raw score greater than the maximum of the raw scores for the cohort in the baseline period, assign it a scaled score of 100, if an Episode Initiator has a raw score less

²³ The following quality measures are exceptions: Patient Centered Surgical Risk Assessment and Communications, Substance Use Screening and Intervention Composite, and Bariatric Surgery Standards for Successful Programs Measure. These quality measures have a baseline period of CY2021. Note that these measures may adopt a different baseline depending on MY4 data availability. If the baseline is updated, the changes will be incorporated in future versions of this document.

than the minimum of the raw scores for the baseline period, assign it a scaled score of 0. If an Episode Initiator has no raw quality score, do not assign them a scaled quality score.²⁴ If the measure has fewer than 100 entities within the baseline, use the higher value between the raw score and percentile. Please refer to Tables 7a and 7b for an example of scaled quality score determination. Please refer to Table 7c for an example of scaled quality score determination when the entity has fewer than 100 entities in the baseline.

Table 7a. Example of Scaling Raw Quality Scores, Distribution of Raw Quality Scores of the Cohort in the Baseline

Percentile	Raw scores (Score is Higher for Better Performance)	
	Lower bound	Upper bound
1	28	32
...
71	49	49
72	50	53
73	53	58
...
100	87	90

²⁴ Episode Initiators that do not meet the minimum observation threshold for the quality measure will be treated as having a missing raw quality score.

Table 7b: Example of Scaling Raw Quality Scores, Performance Period Scores

Episode Initiator	Raw Quality Score	Scaled Quality Score
0012	52	72
1139	53	73
5212	56	73
4132	49	71
1528	23	0
3412	95	100
2336	-	-

Table 7c: Example of Scaling Raw Quality Scores, Performance Period Scores, for quality measures with <100 Episode Initiators in the Baseline

Episode Initiator	Raw Quality Score	Initial Scaled Quality Score	Final Scaled Quality Score
0012	52	72	72
1139	53	73	73
3243	65	40	65
5212	56	73	73
4132	49	71	71
1528	23	0	23
3412	95	100	100
2336	-	-	-

- Step 8. Calculate the Total Attributed Clinical Episodes for which the Quality Measure is Applicable, at the Episode Initiator-Clinical Episode Category-Quality Measure Level:** For every Episode Initiator and all their active Clinical Episode Categories, determine which quality measures are applicable. A quality measure is applicable to a Clinical Episode Category for an Episode Initiator if two conditions are met:

- i) The quality measure is in the measure set that the Episode Initiator chose for the Clinical Episode Category.
- ii) The quality measure is specified as relevant to the Clinical Episode Category in the quality measure fact sheet.

In Table 8a we give an illustrative example for a PGP that is active in the Neurological Care Clinical Episode Service Line Group, which contains two Clinical Episode Categories: IP-Seizures and IP-Stroke. The example PGP has opted into the Alternate measure set for IP-Seizures and IP-Stroke. All-cause readmission and ACP are in both measure sets and are relevant for all Clinical Episode Categories so they are both applicable for all active Clinical Episode Categories for all Episode Initiators. 3-Item Care Transition Measure (CTM-3) is a quality measure included in the Alternate measure set, which is relevant to the IP-Seizures Clinical episodes. Tobacco Use Screening and Cessation Intervention (Tobacco Screening-Registry), Stroke: Discharged on Statin (STK-06), and Time to ITT are all in the Alternate measure set and are all relevant for the IP-Stroke Clinical Episode Category.

Table 8a: Determining Quality Measures (QMs) Applicable to Clinical Episode (CE) Categories for an Example PGP

Quality Measure	QM Contained in Quality Measure Set Chosen for CE Category?		QM Relevant to CE Category		QM Applicable to CE Category for PGP?	
			IP-Seizures	IP-Stroke	IP-Seizures	IP-Stroke
<u>Chosen Quality Measure Set</u>	<u>Admin.</u>	<u>Alternate</u>				
All-Cause Readmission	Y	Y	Y	Y	Y	Y
ACP	Y	Y	Y	Y	Y	Y
CTM-3	N	Y	Y	N	Y	N
Tobacco Screening-Registry	N	Y	N	Y	N	Y
Stroke: Discharged on Statin	N	Y	N	Y	N	Y
Time to ITT	N	Y	N	Y	N	Y

Note: Alternate measure set quality measures are not included in the table unless they are relevant for at least one of the example PGP’s Clinical Episode Categories.

- **Step 8a:** For each Episode Initiator-quality measure combination, calculate the total number of attributed Clinical Episodes for which the quality measure is applicable.

Table 8b continues the example begun in Table 8a.

Table 8b: Calculating the Total Number of Clinical Episodes (CEs) for which each Quality Measure (QM) is Applicable for an Example PGP

Quality Measure	QM Applicable to Clinical Episode Category for PGP?		Count of Attributed Performance Period CEs for which the QM is Applicable		
	IP-Seizures	IP-Stroke	IP-Seizures	IP-Stroke	Total
Attributed CEs			200	200	
CEs for which QM is Applicable					
All-Cause Readmission	Y	Y	200	200	400
ACP	Y	Y	200	200	400
CTM-3	Y	N	200	0	200
Tobacco Screening - Registry	N	Y	0	200	200
Stroke: Discharged on Statin	N	Y	0	200	200
Time to ITT	N	Y	0	200	200

Note: Alternate measure set quality measures are only included in the table if they are relevant for at least one of the example PGP’s Clinical Episode Categories.

- **Step 8b** For PGP Episode Initiators, split out their attributed Clinical Episodes in each Clinical Episode Category by the ACH at which the Clinical Episodes were initiated.

Table 8c continues the example begun in Table 8a.

Table 8c: ACH breakdown of Example PGP’s Attributed Clinical Episodes

ACHs at which Clinical Episodes were Initiated	PGP’s Attributed Clinical Episodes	
	IP-Seizures	IP-Stroke
ACH-A	100	50
ACH-B	100	150
Total	200	200

- **Step 8c:** For each of the PGP’s hospital-based quality measures, repeat Step 8a separately for each ACH at which their attributed Clinical Episodes were initiated.
- **Step 8d:** For each combination of PGP and hospital-based quality measure category, calculate the scaled quality measure score as the average of the non-missing scaled quality measure scores of the ACHs at which the PGP initiates Clinical Episodes, weighted by the number of the PGP’s attributed Performance Period Clinical Episodes initiated at the ACH during the Performance Period for which the quality measure is applicable to the Clinical Episode Category.²⁵

²⁵ In MY4, applicable CECs for a QM are those that are both listed in the denominator for the QM, and also had the QM selected for the CEC.

Table 8d: Example of Calculating PGP Scores in Hospital-Based Quality Measures

Quality Measure	ACH-A		ACH-B		PGP Scaled Quality Score
	Count of Performance Period Clinical Episodes Attributed to the PGP, Initiated at ACH A, and for which the QM is Applicable	ACH Scaled Quality Measure	Count of Performance Period Clinical Episodes Attributed to the PGP, Initiated at ACH B, and for which the QM is Applicable	ACH Scaled Quality Measure	
All-Cause Readmissions	150	68	250	92	83
CTM-3	100	22	100	87	54.50
Tobacco Screening - Registry	50	71	150	-	71
STK-06	50	52	150	27	33.25
Time to ITT ²⁶	50	60	200	-	60

Notes:

*Alternate measure set quality measures are not included in the table unless they are relevant for at least one of the example PGP’s Clinical Episode Categories.

* Missing values are denoted with -.

* PGP Scaled Quality Scores are rounded to the nearest hundredth in this table. In the CQS calculation the additional decimal places will be retained until the final step.

- **Step 9. Compute the Composite Quality Score:** Calculate each Episode Initiator’s Composite Quality Score as the average of their non-missing scaled quality scores, weighted by the count of the Episode Initiator’s attributed Performance Period Clinical Episodes for which the quality measure is applicable.

Table 9 continues the example begun in Table 8a. The scaled quality scores for the hospital-based measures come from Table 8d, the scaled quality scores for measures such as ACP are calculated directly at the Episode Initiator level and scaled as described in Step 7.

²⁶ ACH B did not receive a scaled score for Time to ITT due to an insufficient clinical episode count at the ACH-level. Therefore, PGP1 will receive a scaled score for Time to ITT only based on ACH A.

Table 9: Calculating the CQS

Quality Measure	Scaled Quality Score	Count of Performance Period Clinical Episodes Attributed to the EI, and for which the QM is Applicable	Normalized Weight
All-Cause Readmission	83.00	400	0.250
ACP	79.00	400	0.250
CTM-3	54.50	200	0.125
Tobacco Screening Registry	71.00	200	0.125
STK-06	33.25	200	0.125
Time to ITT	60.00	200	0.125
CQS	67.84		

Notes:

*Alternate measure set quality measures are not included in the table unless they are relevant for at least one of the example PGP’s Clinical Episode Categories.

* Missing values are denoted with -.

* Scaled quality scores displayed in the table above are rounded to the nearest hundredth. The CQS calculation uses the unrounded figures.

8 CALCULATE RECONCILIATION AMOUNTS

This section describes how to calculate unadjusted Reconciliation amounts that will be disseminated to Participants during the initial Reconciliation. The initial Reconciliation amount does not adjust for the Episode Initiator's performance on quality measures.²⁷ This step includes applying the stop-loss/stop-gain provision and calculating NPRA/Repayment Amount. To illustrate how to calculate Reconciliation amounts, this section uses fabricated data, presented in Tables 10 through 12. Table 10 shows how to calculate Reconciliation amounts at the Episode Initiator-Clinical Episode Category level. Tables 11 and 12 show how to aggregate these Reconciliation amounts to the Episode Initiator and Convener Participant levels respectively.

To calculate Reconciliation amounts for Model Year 4, take the following steps:

- **Step 10 Calculate Positive Reconciliation Amount and Negative Reconciliation Amount at the Clinical Episode Category level:** For each Episode Initiator and Clinical Episode Category, calculate Reconciliation amount as the difference between the Total Performance Period Target Amount (**Step 6**) and final Performance Period Clinical Episode payments (**Step 2**).²⁸ If the Total Performance Period Target Amount for an Episode Initiator exceeds final Performance Period Clinical Episode payments during the Performance Period, it results in a Positive Reconciliation Amount. If the Total Performance Period Target Amount is less than the final Performance Period Clinical Episode payments, the result is a Negative Reconciliation Amount.

²⁷ Note that quality adjustments will be applied to Reconciliation amounts in the true-up calculations through the CQS. For all initial Reconciliations and initial true-ups occurring in Spring, when the CQS is not yet available, the temporary CQS will be a 0 out of 100 for all Episode Initiators, pending replacement.

²⁸ Represented mathematically as *Positive/Negative Reconciliation Amount*_{m,ce,t} = *Total Performance Period Target Amount*_{m,ce,t} – *Final Performance Period Clinical Episode Payment*_{m,ce,t}

Table 10: Calculate Positive/Negative Reconciliation Amount in Real Dollars

Episode Initiator	PGP/ACH	Clinical Episode Category	Number of Performance Period Clinical Episodes	Step 2a	Final Performance Period Clinical Episode Payments		Total Performance Period Target Amount	Step 10
				Ratio of Real Dollars to Standardized Dollars	Step 1	Step 2b	Step 6	Positive/Negative Reconciliation Amount in Real Dollars
					Standardized Dollars	Real Dollars	Real Dollars	
H1000	ACH	CE1	34	1.01	\$945,744	\$955,201	\$834,122	-\$121,079
H1000	ACH	CE2	15	1.04	\$378,315	\$393,448	\$282,540	-\$110,908
H1000	ACH	CE3	28	0.99	\$1,452,500	\$1,437,975	\$1,476,048	\$38,073
H1000	ACH	CE4	45	0.89	\$2,422,260	\$2,155,811	\$1,323,225	-\$832,586
H1000	ACH	CE5	52	1.11	\$1,540,812	\$1,710,301	\$1,426,932	-\$283,369
H2000	ACH	CE1	12	1.02	\$215,328	\$219,635	\$246,012	\$26,377
H2000	ACH	CE2	1	1.01	\$20,798	\$21,006	\$37,562	\$16,556
H2000	ACH	CE3	14	0.86	\$215,166	\$185,043	\$211,596	\$26,553
H2000	ACH	CE4	150	0.93	\$3,198,300	\$2,974,419	\$2,951,400	-\$23,019
P000	PGP	CE1	15	1.01	\$238,218	\$240,600	\$476,220	\$235,620
P000	PGP	CE2	17	1.05	\$231,963	\$243,561	\$545,231	\$301,670

Note: Examples are not associated with the fabricated data used in other BPCI Advanced specifications documents. All dollar values are rounded to the nearest dollar and ratios are rounded to two decimal places.

- Step 11. Calculate Positive Total Reconciliation Amount and Negative Total Reconciliation Amount at the Episode Initiator level:** For an Episode Initiator, aggregate Positive Reconciliation Amounts and Negative Reconciliation Amounts (**Step 10**) across all Clinical Episode Categories to obtain either Positive Total Reconciliation Amount or Negative Total Reconciliation Amount.
- Step 12. Calculate Adjusted Positive Total Reconciliation Amount and Adjusted Negative Total Reconciliation Amount at the Episode Initiator Level:** For the initial Reconciliation, calculate the Adjusted Positive Total Reconciliation Amount and the Adjusted Negative Total Reconciliation Amount by temporarily withholding the potential CQS Adjustment Amount at risk (i.e.10% for Model Year 4) to the Positive Total Reconciliation Amount and the Negative Total Reconciliation Amount. Specifically, at the Episode Initiator level, the Adjusted Positive Total Reconciliation Amount will equal 90% of the Positive Total Reconciliation Amount, while the Adjusted Negative Total Reconciliation Amount will equal the Negative Total Reconciliation Amount.²⁹ This is the equivalent of CQS of zero and ensures that Participants will only receive increases (or

²⁹ If $Total\ Reconciliation\ Amount_{m,t} > 0$ then $Adjusted\ Total\ Reconciliation\ Amount_{m,t} = Total\ Reconciliation\ Amount_{m,t} * 0.9$. If $Total\ Reconciliation\ Amount_{m,t} < 0$ then $Adjusted\ Total\ Reconciliation\ Amount_{m,t} = Total\ Reconciliation\ Amount_{m,t}$. Where Total Reconciliation Amount is represented mathematically as $Total\ Reconciliation\ Amount_{m,t} = \sum_{ce \in CE} * Reconciliation\ Amount_{m,ce,t}$

no change) in their Adjusted Total Reconciliation Amount associated with their CQS during true-up calculations.³⁰ During the true-up Reconciliations occurring in Fall each year, as applicable, apply the CQS Adjustment Amount to the Positive Total Reconciliation Amount and Negative Total Reconciliation Amount to revise the Adjusted Positive Total Reconciliation Amount and Adjusted Negative Total Reconciliation Amount respectively from earlier Reconciliation calculations when the CQS was not available (Refer to **Step 18** for more details.)

- **Step 13. Apply the 20% stop-loss/stop-gain provision:** As shown in Table 11, if the Episode Initiator’s Adjusted Positive Total Reconciliation Amount (**Step 12**) is greater than 20% of the Total Performance Period Target Amount (**Step 6**) or if the absolute value of its Adjusted Negative Total Reconciliation Amount is greater than 20% of the Total Performance Period Target Amount, then apply the 20% stop-loss/stop-gain provision.³¹ The Adjusted Positive/Negative Total Reconciliation Amount that incorporates 20% stop-loss/stop-gain where applicable is the capped Adjusted Positive/Negative Total Reconciliation Amount.

Table 11: Calculate Adjusted Positive/ Negative Reconciliation Amount at the Episode Initiator Level

Episode Initiator	Step 11	Step 12	Step 6	Step 13	Step 13
	Positive/Negative Total Reconciliation Amount	Adjusted Positive/Negative Total Reconciliation Amount	20% of Total Performance Period Target Amount	Apply Stop-Loss/Stop-Gain	Capped Adjusted Positive/ Negative Total Reconciliation Amount
H1000	-\$1,309,869	-\$1,309,869	\$1,068,573	Yes	-\$1,068,573
H2000	\$46,467	\$41,820	\$689,314	No	\$41,820
P000	\$537,290	\$483,561	\$204,290	Yes	\$204,290

Note: Examples are not associated with the fabricated data used in other BPCI Advanced specifications documents. All dollar values are rounded to the nearest dollar.

- **Step 14. Calculate NPRAs and Repayment Amounts:** As shown in Table 12, for each Participant, aggregate the capped Adjusted Positive/ Negative Total Reconciliation Amount (Step 13) across all applicable Episode Initiators to obtain either NPRA or

³⁰In subsequent true-up calculations when an updated CQS is available, the application of a CQS adjustment will result in either no change to, in the case of a CQS of zero, or a positive adjustment to, either the Adjusted Positive Total Reconciliation Amount or Adjusted Negative Total Reconciliation Amount, in the case of a CQS which exceeds 0.

³¹ Represented as:

If Adj Positive Total Reconciliation Amount, then $\min(\text{Adj Positive Total Reconciliation Amount}, 20\% \text{ of Total Performance Period Target Amount})$,

If Adj Negative Total Reconciliation Amount, then $\min(\text{abs}(\text{Adj Negative Total Reconciliation Amount}), 20\% \text{ of Total Performance Period Target Amount})$

Repayment Amount. Skip this step if the Episode Initiator is a Non-Convener Participant.³²

Table 12: Calculate NPRAs/ Repayment Amounts at the Convener Participant Level

Episode Initiator	Step 13	Step 14
	Capped Adjusted Positive/ Negative Total Reconciliation Amount	Convener-Level NPRA/ Repayment Amount
H1000	-\$1,068,573	-\$822,463
H2000	\$41,820	
P000	\$204,290	

Note: This table assumes H1000, H2000, and P000 from Table 12 are now the complete list of Episode Initiators under the Convener Participant. Examples are not associated with the fabricated data used in other BPCI Advanced specifications documents. All dollar values are rounded to the nearest dollar.

³² For a Non-Convener Participant, the capped Adjusted Positive/Negative Total Reconciliation amount in Step 13 is the NPRA/ Repayment Amount, respectively.

9 CALCULATE TRUE-UP AMOUNTS

This section describes how to perform true-up calculations to update initial Reconciliation amounts and prior true-ups using claims processed as of a later date as well as quality measure data. True-ups calculations are conducted approximately six months and one year after initial Reconciliation occurs. Both true-up calculations will factor in newly processed claims. Quality measurement data that is calculated once per year, will be first incorporated in the Fall true-up and continue to be incorporated in any subsequent true-ups for a given Performance Period.³³ To illustrate true-up calculations, this section uses fabricated data.³⁴

- **Step 15. Recalculate Performance Period Clinical Episode Payments:** Using the set of newly processed claims data, follow **Steps 1-2** to calculate final Performance Period Clinical Episode payments.
- **Step 16. Recalculate Final Target Prices and Total Performance Period Target Amounts:** Using the new set of claims data, follow **Steps 3-6** to calculate final Target Prices and Total Performance Period Target Amounts. Note that the updated set of claims data will only reflect changes in Target Price components that use realized Performance Period data, i.e. updated PCMA, updated Relative Case Mix, capped PGT Factor Adjustment and realized ratio of real to standardized dollars.
- **Step 17. Recalculate Reconciliation Amounts:** Follow **Steps 10-11** to recalculate Positive and Negative Total Reconciliation Amounts at the Episode Initiator level.
- **Step 18. Incorporate CQS into Positive/Negative Total Reconciliation Amount:** Apply the CQS Adjustment Amount to the Positive Total Reconciliation Amount and Negative Total Reconciliation Amount using the following steps. Table 13 below shows how this calculation is implemented using the example from Section 8.
 - **Step 18a.** Calculate the CQS Adjustment Amount, which reflects the amount by which the Total Reconciliation Amount will be adjusted as a result of the Episode Initiator's performance on the CQS. First, calculate the CQS Adjustment Percent. For Model Year 4, the maximum percent at risk is 10%; thus an Episode Initiator may have the magnitude of its Total Reconciliation Amount reduced by 0 to 10%. For Positive Total Reconciliation Amounts, the CQS Adjustment Percent is inversely proportional to the CQS and scaled to 10% (i.e. CQSs of 0 and 100 have CQS Adjustment Percentages of 10% and 0%, respectively). For Negative Total

³³ For Performance Period 5, CQS will be applied for the first time to the second true-up; while for Performance Period 6, CQS will be applied for the first time to the first true-up and carried through to the second and for Performance Period 7, CQS will be applied for the first time during the initial Reconciliation cycle and carried through to the first and second true-ups.

³⁴ Fabricated data used in this section are not associated with fabricated data used in other BPCI Advanced specifications documents.

Reconciliation Amounts, the CQS Adjustment Percent is proportional to the CQS and scaled to 10% (i.e. CQSs of 0 and 100 have CQS Adjustment Percentages of 0% and 10%, respectively). Please refer to the equation in the footnote for the exact calculation.³⁵ Next, multiply the CQS Adjustment Percent by the Episode Initiator-level Total Reconciliation Amount to get the CQS Adjustment Amount, which will be positive for Positive Total Reconciliation Amounts, and negative for Negative Total Reconciliation Amounts.

- **Step 18b.** Subtract the CQS Adjustment Amount from the Episode-Initiator level Total Reconciliation Amount (**Step 17**) to get the Adjusted Total Reconciliation Amount for each Episode Initiator. For Negative Total Reconciliation Amounts this corresponds to a reduction in the amount owed to CMS (provided the CQS Score was greater than 0), and for Positive Total Reconciliation Amounts this corresponds to a decrease in the amount CMS owes the Participant (provided the CQS Score was less than 100).
- **Step 18c.** Repeat **Step 13** to apply the 20% stop-loss/stop-gain provision to get the capped Adjusted Positive/Negative Total Reconciliation Amount for each Episode Initiator.
- **Step 18d** For Convener Participants, sum all their Episode Initiators' capped Adjusted Positive Total Reconciliation Amounts and Adjusted Negative Total Reconciliation Amounts to obtain NPRA/Repayment Amount.

Table 13: Calculate NPRA/Repayment Amount with CQS Payment Adjustment at the Convener Participant Level

Episode Initiator	Step 17	Step 9	Step 18a		Step 18b	Step 18c	Step 18c	Step 18c	Step 18d
	Positive/Negative Total Reconciliation Amount	CQS	CQS Adjustment Percent	CQS Adjustment Amount	Adjusted Positive/Negative Total Reconciliation Amount	20% of Volume Weighted Target Price	Stop-Loss/Stop-Gain	Capped Adjusted Positive/Negative Total Reconciliation Amount	Convener-Level NPRA/Repayment Amount
H1000	-\$1,309,869	50	5%	-\$65,493	-\$1,244,376	\$1,068,573	Yes	-\$1,068,573	-\$819,675
H2000	\$46,467	65	4%	\$1,859	\$44,608	\$689,314	No	\$44,608	
P000	\$537,290	77	2%	\$10,746	\$526,544	\$204,290	Yes	\$204,290	

Data shown are from the initial Reconciliation calculation examples. In practice, true-up calculations will use newly processed claims data. Examples are not associated with the fabricated data used in other BPCI Advanced specifications documents. All dollar values are rounded to the nearest dollar.

³⁵ Represented mathematically as $CQS\ Adjustment\ Amount_{m,t} = CQS\ Adjustment\ Percent_{m,t} * Total\ Reconciliation\ Amount_{m,t}$ where:

$$CQS\ Adjustment\ Percent_{m,t} = \begin{cases} \text{if } Total\ Reconciliation\ Amount_{m,t} > 0 \text{ then, } \left(10\% - 10\% * \frac{CQS_{m,t}}{100}\right) \\ \text{if } Total\ Reconciliation\ Amount_{m,t} < 0 \text{ then, } 10\% * \frac{CQS_{m,t}}{100} \end{cases}$$

- **Step 19. Calculate True-Up amount:** Once the NPRA/Repayment Amounts are calculated for the true-up cycle, calculate true-up amount for each Participant by comparing the new amount with the previous amount. For a Participant, the true-up amount will be the difference between the NPRA/Repayment Amount in the current true-up period and NPRA/Repayment Amount in the previous period.³⁶

Table 14: Calculate True-Up Amount at the Convener Participant Level

Step 18d	Step 14	Step 19
Recalculated NPRA/Repayment Amount	NPRA/Repayment Amount from Previous Calculation	True-Up Amount
-\$819,675	-\$822,463	\$2,788

Note: The True-Up amount is always calculated as the difference between the NPRA/Repayment Amount calculated for the current True-Up period and the most recent previous NPRA/Repayment Amount calculation.

³⁶ Represented mathematically as $True-Up Amount_{P,t} = NPRA Amount/Repayment Amount_{P,t} - NPRA Amount/Repayment Amount_{P,(t-1)}$, where,
P is the Participant
t is the applicable Performance Period
(t-1) is the previous Performance Period

10 CALCULATE EXCESS SPENDING AMOUNTS

To reduce Participants' incentives to withhold or delay medically-necessary care until after a BPCI Advanced Clinical Episode ends, BPCI Advanced Participants are responsible for statistically implausible increases in post-episode spending between days 91 and 120 of the Post-Episode Spending Monitoring Period.³⁷ The Post-Episode Spending Calculations for a Performance Period will occur at the same time as the first true-up calculations and will be recalculated during the second true-up to account for newly processed claims. For example, Participants with Clinical Episodes ending between January 2021 and June 2021 will receive their first Post-Episode Spending Calculations in Spring 2022.

- **Step 20. Attribute services and payments to the Post-Episode Spending Monitoring Period:** Considering all baseline period and Performance Period Clinical Episodes, attribute Parts A and B claims with a standardized payment amount greater than zero that overlap with days 91-120 of the Post-Episode Spending Monitoring Period.
- **Step 21. Apply payment aggregation logic for the Post-Episode Spending Monitoring Period:** For baseline period and Performance Period Clinical Episodes, follow **CE-Steps 14-18** to:
 - Apply BPCI Advanced exclusions criteria,³⁸
 - Prorate claims that extend before or after the Post-Episode Spending Monitoring Period, and
 - Calculate overall Post-Episode Spending payment amounts.
- **Step 22. Apply Setting-Specific Price Update Factor Associated with the Preceding Clinical Episode:** For constructing baseline period Post-Episode Spending, follow **CE-Steps 19-21** to update payments occurring in the Post-Episode Spending Monitoring Period to Performance Period dollars. Assign post-episode spending to baseline years using the Anchor Stay or Anchor Procedure end date of the preceding Clinical Episode.
- **Step 23. For each Clinical Episode Category and Model Year sub-period, estimate a Clinical Episode-level risk adjustment model for Post-Episode Spending using the final set of baseline Clinical Episodes at eligible ACHs:** Run a two-stage risk adjustment model to estimate baseline Post-Episode Spending similarly to **TP-Steps 1-4**. Run a separate risk-adjustment model for each sub-period of MY4 with Post-Episode Spending updated to the appropriate calendar and fiscal year (CY2021/FY2021, CY2021/FY2022), and for each Clinical Episode Category.

³⁷ Please note: If a COVID-19 diagnosis first occurs in the Post-Episode Spending Monitoring Period, the Clinical Episode will be reconciled and Post-Episode Spending Calculations will occur, as usual.

³⁸ Please note: For MY4, COVID-19 exclusions are applied to the national set of episodes.

- **23a.** Drop episodes where the beneficiary died during the Clinical Episode window. (Note that Clinical Episodes where the beneficiary dies during the Post-Episode Spending Monitoring Period are retained.)
- **23b.** Estimate a compound log-normal risk adjustment model for the Post-Episode Spending. The Post-Episode Spending risk adjustment model differs from the compound log-normal risk adjustment model (**TP-Step 2**) in two main ways:
 - For Post-Episode Spending the compound-log normal model includes a zero node, to accommodate Clinical Episodes with no Post-Episode Spending.
 - For Post-Episode Spending, the peer group characteristics are not included in the model.³⁹
- **23c.** Calculate the Clinical Episode level patient case-mix adjustment amount, as the predicted Clinical Episode level Post-Episode Spending conditional on the compound log-normal model and the patient characteristics.
- **23d.** Capture coefficients for national trends using the procedure outlined in **TP-Step 4**, but exclude the peer group interactions from the regression.
- **Step 24. For each ACH and PGP in each Clinical Episode Category, calculate the Post-Episode Spending penalty threshold as the upper bound of the 99.5% confidence interval for the Post-Episode Spending Target Amount:** The structure of the Post-Episode Spending Benchmark Prices and Target Amounts follow the same structure as the in-Episode Spending Target Amounts with a few exceptions:
 - Clinical Episodes where the beneficiary died during the episode window are not included in the Benchmark Prices or the Target Amounts.
 - Rather than a peer adjusted trend factor, there is a national trend factor.⁴⁰
 - The Post-Episode Spending Target Amount does not factor in a 3% CMS discount.

To determine the upper bounds of the 99.5% confidence intervals of the Post-Episode Target Amounts, conduct a Krinsky and Robb simulation with a sufficiently high number of iterations. For each EI and Clinical Episode Category take the 99.75th percentile of the Post-Episode Target Amounts across the iterations.
- **Step 25. Calculate Performance Period Post-Episode spending:** For all attributed Performance Period Clinical Episodes, aggregate Performance Period post-episode

³⁹ This prevents EIs from being advantaged/ disadvantaged by the size of their peer group, since otherwise the volume of EIs in the peer group affects the size of the confidence intervals for the Post-Episode Spending Amounts.

⁴⁰ In MY4, the trend factor adjustment re-centers the benchmark prices around realized spending in the Performance Period. The trend factor adjustment will be capped so that the maximum difference between the prospective national trend and realized national trend is 10%.

spending amounts to the Clinical Episode Category level following the methodology in **Step 1**.

- **Step 26. Convert Post-Episode Spending penalty threshold and Performance Period Post-Episode spending to real dollars:** Convert the Post-Episode spending penalty threshold and Performance Period Post-Episode spending to real dollars by multiplying each amount by a ratio of the sum of real Post-Episode spending to sum of standardized Post-Episode spending in the Performance Period for each Episode Initiator and Clinical Episode Category.
- **Step 27. Reconcile the Post-Episode Spending penalty threshold against realized Performance Period Post-Episode Spending:** If Performance Period Post-Episode spending minus the Post-Episode penalty threshold is greater than zero, this amount represents the Excess Spending Amount owed to Medicare. If Performance Period Post-Episode spending minus the Post-Episode penalty threshold is less than or equal to zero, the Episode Initiator is not liable for an Excess Spending Amount in the Clinical Episode Category.
- **Step 28. Calculate Excess Spending Amounts at the Convener Participant level:** For all Episode-Initiators under a Convener Participant, aggregate the Episode Initiator-Clinical Episode Category level Excess Spending Amounts to the Convener Participant level.
- **Step 29. Recalculate Excess Spending Amount:** During the second true-up calculation for each Performance Period, repeat **Steps 20-28** using newly processed claims.
- **Step 30. Calculate Excess Spending True-Up Amount:** Once the new amounts are calculated for the true-up cycle, calculate true-up amount for each Participant by comparing the new amount with the previous amount.
